Dear Council Members:

The chemicals above are the major treatment chemicals requiring your consideration for passage. These bulk chemicals are required to remove various impurities from the river water to convert the water to a drinkable condition referred to as "Potable." The liquid ferric sulfate is utilized to enhance removal of impurities. Pebble lime is the component of treatment that removes impurities and performs the softening. Powdered activated carbon is used to remove taste, odor and color (and some volatile solvents, pesticides, etc.). Soda Ash is used to convert non-carbonate hardness to carbonate hardness. Liquid CO2 is added to the water after the lime-softening process to lower the pH in order to reduce calcium carbonate scale formation. This process is known as recarbonation. Without these five (5) chemicals we cannot treat the water to make it potable. If you have any further questions, please call me at 427-1254 ext 1403.

Very truly yours,

  
Doug Pooler  
Superintendent
